ACLS for EMTs Nov 26 2020 EMTs can find themselves in critical situations that require advanced cardiac life support (ACLS). Although EMTs are not trained to provide advanced-level skills, there is much they can do to improve the quality of management, and thus the patient's chance for survival by understanding ACLS and facilitating its administration by ALS providers. Teamwork is the cornerstone of ACLS care. Advanced life support can only function on a foundation of solid, ongoing basic life support practices. As such, an understanding of the principles of advanced life support will enhance the ability of EMTs to work in collaboration to increase the survival rates of patients. Most importantly, better teamwork will improve care not only during cardiac arrests, but also during all emergency calls.

8 - Manual Or Automatic Defibrillators for the In-hospital Setting: Suggested Choice Criteria Feb 10 2022 Introduction: Hospitals are bound to provide a safe environment. Early defibrillation is a key factor in this respect. Outside in-hospital high-risk areas, the use of defibrillators is infrequent. However, even when rapid response teams (RRT) bring their own equipment, the benefit from early shocks strongly suggest their immediate availability. Currently there are no guidelines as to choice, placement strategies, or types/level of defibrillators for in-hospital settings, despite investment costs. Purpose: Development of rational criteria for type and placement of defibrillators for in-hospital settings. Methods: Literature research concerning the deployment of defibrillators in hospitals. We selected all hospitals and manufacturers in the Netherlands, using a standardized questionnaire, enquired as to their defibrillator investment and placement strategies.

Using the literature and level-of competence legislation, we merged this into criteria for type and placement. Results: We were unable to find validated arguments supporting type/placement of defibrillator (AED vs manual) with a wide range of devices-to-patient ratios. Guidelines support deployment of a defibrillator anywhere in the hospital within 3 minutes. All respondents noted low incidence of use coupled with a low sensitivity to costs. We found that nurses prefer AEDs over manual defibrillators with an AED function. Rational choice criteria were: a) population (in vs out of hospital), b) potential for collapse, c) user competence, d) arrival time RRT, e) time to retrieve, f) positioning same level within reasonable distance (visibility), g) combination with everything needed (crash cart). Conclusions: A wide range of variation in placement strategies and type of defibrillators for the in-hospital setting in the Netherlands. (Cost) effective placement of defibrillators support use of AEDs over manual defibrillators in RRT-based systems even though they may have negative effects. Potential users influence type/placement strategies. Some rational criteria allow for suitable and safe strategies.

Processing Times And Usability Of Manual Defibrillators Dec 20 2022 Background: Manual Defibrillators underwent a rapid technical progress. The accurate use of a manual defibrillator can prevent a delay in starting CPR and reduce interruptions of chest compressions. In order to obtain an objective evaluation of a deviceu2019s usability, eye-tracking measurements have recently become a promising method. Eye-tracking can expose cognitive processes and visual attention during problem-solving tasks, which is an important part of understanding human reasoning. It was the aim of this study to evaluate the usability of modern

manual defibrillators from 4 different manufacturers. We requested a series of tasks representing typical operator/device interactions during a cardiac arrest scenario. Successful task execution and processing times were measured. Additionally, while the operators were performing the tasks, their visual focuses were assessed via mobile eye-tracking. Thereafter, their subjective perception of usability was evaluated by a standardized usability questionnaire. The hypothesis of our study was that the usability of manual defibrillators differs between the devices according to the requested task. **Methods:** After informed consent (ERB of the University of Freiburg), 43 voluntary operators were asked to execute 15 tasks representing typical operating steps during acute defibrillation, cardioversion or pace-maker stimulation (see Y-axis Figure 2), at 4 different defibrillators (LifepakTM 20 (Physio-Control Inc., USA), Defigard Touch 7TM (Schiller, Switzerland), Corpuls 3TM (GS, Germany) and X SeriesTM ALS (Zoll-Chelmsford, USA) (Fig. 1). Operators were naïve to the included devices. The operators' gazes were measured via an eye-tracking device (Tobii Pro Glasses 2, Tobii AB, Sweden). From these data, task's processing time (TD) and the operator's gaze distribution (Heat Map) were analysed. After having executed the task, the operators evaluated the usability via a standardized questionnaire. The primary endpoint was TD. Secondary endpoints included gaze distribution and usability score (data given as mean ± 1SD; n=31)
